

Management deck outline — P3 AD security assessment (5 slides)

Audience: Managing Director, department heads · **Duration:** 10 minutes plus questions **Prepared by:** Muhammad Ibrahim Akmal, IT (Systems) · **Date:** 2026-10-02 **Status:** outline only — the measured figures are added after the assessment run and the deck is presented then. The approval block stays unsigned until it is.

Design rule for this deck: business language first, technology second, and never a score without one sentence explaining what it means. The technical detail belongs in the findings register, which is the supporting document for this deck.

Slide 1 — The risk in plain terms

Headline: "One careless click is currently enough to lose the whole network."

- Every workstation shares one local administrator password.
- IT uses a single administrator account for everything, including email.
- People who have left still hold the highest level of access.
- System passwords have not changed in years.

One supporting fact (from the market research): credential abuse is the most common way attackers get in (22% of breaches), and ransomware reaches 88% of small-business breaches — attackers escalate to directory control first because that is what lets them encrypt everything at once.

Visual: the before/after attack-path diagram (sanitized), not a wall of settings.

Slide 2 — What we actually looked at, and how

- We ran three free, well-known assessment tools against our own directory, inside our isolated lab and with written authorisation.
- We scored every finding by likelihood and impact and put it in one register with an owner and a date.
- We did **not** run a penetration test: this maps weak settings and reachable permissions, it does not break in or crack passwords.
- **Visual:** the register's first page, and the risk score with its four categories.

Slide 3 — What we fixed, and what it changes for the business

We changed	So that
One unique, rotating local administrator password per computer	A single compromised laptop is no longer a key to every other computer
Separate administrator accounts per person and per tier	An admin's email or browsing can never hand over the domain

We changed	So that
Elevated access removed from people who do not need it	Fewer doors left open by accident, and a written answer to "who can change the domain?"
Legacy protocols switched off after an audit period	A family of well-known attacks, which needs no user mistake, stops working
Helpdesk rights delegated instead of granted	Routine support no longer requires the highest level of access

Visual: the tier diagram (Tier 0 / Tier 1 / Tier 2) with the logon arrows.

Slide 4 — Results: the score moved

- Overall directory risk score: **[before]** → **[after]** (the same tool, run the same way, so the comparison is fair).

- Reachable paths from an ordinary account to full administrator control: **[before]** → **[after]**.
- Endpoints with their own managed local administrator password: **[before]** → **[after]**.
- Findings closed / open / formally accepted: **[counts]**.

(Every figure on this slide is inserted from a real lab run and cites an evidence file. Until then it stays as a placeholder — the deck is not presented with invented numbers.)

Visual: two bars and one line, plus a single sentence on what the change means for the business.

Slide 5 — What is still open, and what we need

- Still open:** [list of findings not yet fixed, with the reason].
- Accepted for now:** [items with a named business owner, a written reason and a review date].
- Asks:**
 - Confirm that administrator access is a role, not a right — IT will hold two accounts each.
 - Department heads confirm who still needs elevated access (the business owns that decision).
 - One out-of-hours window for the protocol changes, which are audited before enforcement.
 - A decision on anything we recommend accepting rather than fixing.

Reporting commitment: one page a month — what was fixed, what is open, what was accepted and why, and the single headline risk score.

Approval

Role	Name	Decision	Date	Signature
Managing Director				
Finance Director				
Operations Director				
IT (preparer)	Muhammad Ibrahim Akmal			

Unsigned by design. The deck is an outline until the assessment has run and the real figures are in it; the approval block stays blank until the presentation actually happens. Halden Distribution Ltd. is a fictional company in an isolated home lab, and the weaknesses it describes were deliberately seeded so the assessment had something real to find.

Halden Distribution Ltd. — home-lab portfolio artifact (fictional company, real configurations). Generated from p03-management-deck.md on 2026-10-02.
